Applicant(s)

HANE, JOHN

Examiner

Travis R. Hunnings

Art Unit

2612

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 20 April 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-39 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-39 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 09 August 2005 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
- ☐ Certified copies of the priority documents have been received.
  - ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## DETAILED ACTION

### ***Claim Rejections - 35 USC § 102***

1. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
2. Claims 1, 5-8, 10, 13, 15, 19-22, 24, 27, 29 and 33-38 are rejected under 35 U.S.C. 102(b) as being anticipated by Dubats (US Patent 5,559,496).

Regarding claim 1, Dubats discloses *Remote Patrol System* that has the following claimed subject matters:

The claimed detecting means for detecting the presence of an intruder in a predetermined area or a plurality of predetermined areas is met by the one or more object sensors detecting the presence or intrusion in one or more monitored areas (col1 44-49);

The claimed communicating means for communicating via satellite signals from a subscriber location to a processing center the detection of the presence of the intruder in the predetermined area or in one or more of the plurality of predetermined areas is met by the communication link consisting of a satellite link and providing indication to the base station of events that are caused by an intrusion into one of the one or more monitored areas (col2 4-11);

The claimed satellite signals encode data alerting the processing center to the presence of said intruder in said predetermined area or said one or more of the plurality of predetermined areas is met by the monitored area transceiver transmitting modulated data that the base station demodulates to determine the site that sent the signal (col6 1-13);

The claimed receiving means to receive signals from the processing center is met by the transceiver (column 5, lines 47-61);

The claimed satellite signals received from the processing center carry data to activate an alarm/warning system at the subscriber location is met by the remote sites being activated by the base station (column 9, lines 47-55).

Regarding claim 5, Dubats discloses all of the claimed limitations. The claimed security system wherein the detecting means comprises a detection apparatus interface is met by the remote monitor station having one or more object sensors that is interfaced with the transceiver that sends signals to the base station to alert the base station of an intrusion in the monitored area (col1 39-49 and col2 4-11).

Regarding claim 6, Dubats discloses all of the claimed limitations. The claimed security system wherein the processing center comprises a provider antenna for transmitting and/or receiving satellite signals is met by the base station transceiver that is set up to receive signals of intrusion and also to send messages to the remote monitors to instruct them on the desired reporting mode (col1 39-49 and col2 20-44).

The communication link associated between the base station and remote monitors would inherently have an antenna to accomplish the satellite communications as suggested in column 2, lines 4-11.

Regarding claim 7, Dubats discloses all of the claimed limitations. The claimed security system wherein the predetermined area or plurality of predetermined areas is operatively associated with a subscriber antenna at a subscriber location is met by the remote monitor having a transceiver that is associated with a communication link to the base station (col1 39-49 and col2 4-11). The term 'subscriber' is interpreted to mean a location associated with the central processing center that is being monitored. The communication link associated between the base station and remote monitors would inherently have an antenna to accomplish the satellite communications as suggested in column 2, lines 4-11.

Regarding claim 8, Dubats discloses all of the claimed limitations. The claimed security system wherein the detection of the intruder activates the transmission of satellite signals is met by the data transmission of intrusion events being instantaneous to the events being detected by the remote monitors (col2 4-11).

Regarding claim 10, Dubats discloses all of the claimed limitations. The claimed security system wherein the detection of the intruder alters the frequency of the satellite signals is met by the data transmission of intrusion events being instantaneous to the

events being detected by the remote monitors (col2 4-11). The frequency of the signals when an intrusion is not detected is zero because there are no signals being sent and when the intrusion is detected the frequency of the signals changes because a signal is then sent to the base station.

Regarding claim 13, Dubats discloses all of the claimed limitations. The claimed security system further comprising processing means at the processing center for processing satellite signals encoding data alerting said processing center to the presence of the intruder in the predetermined area or plurality of predetermined areas is met by the base station consisting of a microprocessor and software code instructions that allows the computer to interpret event and date information received from monitored areas (col2 20-44).

Regarding claim 15, Dubats discloses the following claimed subject matters:

The claimed detecting means at a subscriber location for detecting the presence of an intruder in a predetermined area or a plurality of predetermined areas is met by the one or more object sensors detecting the presence or intrusion in one or more monitored areas (col1 44-49). The term 'subscriber' is interpreted to mean a location associated with the central processing center that is being monitored;

The claimed communicating means for communicating via satellite signals from a subscriber location to a processing center the detection of the presence of the intruder in the predetermined area or in one or more of the plurality of predetermined areas is

met by the communication link consisting of a satellite link and providing indication to the base station of events that are caused by an intrusion into one of the one or more monitored areas (col2 4-11);

The claimed processing means at the processing center for receiving and processing the satellite signals is met by the base station consisting of a microprocessor and software code instructions that allows the computer to interpret event and date information received from monitored areas (col2 20-44);

The claimed satellite signals encode data alerting the processing center to the presence of said intruder in said predetermined area or said one or more of the plurality of predetermined areas is met by the monitored area transceiver transmitting modulated data that the base station demodulates to determine the site that sent the signal (col6 1-13);

The claimed receiving means to receive signals from the processing center is met by the transceiver (column 5, lines 47-61);

The claimed satellite signals received from the processing center carry data to activate an alarm/warning system at the subscriber location is met by the remote sites being activated by the base station (column 9, lines 47-55).

Regarding claim 19, the claim is interpreted and rejected as claim 5 stated above.

Regarding claim 20, the claim is interpreted and rejected as claim 6 stated above.

Regarding claim 21, the claim is interpreted and rejected as claim 7 stated above.

Regarding claim 22, the claim is interpreted and rejected as claim 8 stated above.

Regarding claim 24, the claim is interpreted and rejected as claim 10 stated above.

Regarding claim 27, the claim is interpreted and rejected as claim 13 stated above.

Regarding claim 29, Dubats discloses the following claimed subject matters:

The claimed communicating means for communicating via satellite signals from a subscriber location to a processing center the detection of the presence of the intruder in the predetermined area or in one or more of the plurality of predetermined areas is met by the communication link consisting of a satellite link and providing indication to the base station of events that are caused by an intrusion into one of the one or more monitored areas (col2 4-11);

The detecting interface means for operatively associating the communicating means with detecting means being able to detect the presence of an intruder in the predetermined area or in one or more of the plurality of predetermined areas is met by the one or more object sensors detecting the presence or intrusion in one or more remote monitor areas and being associated with a remote monitor transceiver that is associated with a communication link that is able to communicate with the base station and alert the base station to the event of an intrusion in one or more of the remote monitor areas (col1 39-49, col2 4-11 and 20-44);

The claimed satellite signals encode data alerting the processing center to the presence of said intruder in said predetermined area or said one or more of the plurality of predetermined areas is met by the monitored area transceiver transmitting modulated data that the base station demodulates to determine the site that sent the signal (col6 1-13);

The claimed receiving means to receive signals from the processing center is met by the transceiver (column 5, lines 47-61);

The claimed satellite signals received from the processing center carry data to activate an alarm/warning system at the subscriber location is met by the remote sites being activated by the base station (column 9, lines 47-55).

Regarding claim 33, the claim is interpreted and rejected as claim 5 stated above.

Regarding claim 34, the claim is interpreted and rejected as claim 6 stated above.

Regarding claim 35, the claim is interpreted and rejected as claim 7 stated above.

Regarding claim 36, Dubats discloses the following subject matters:

The claimed subscriber antenna at a subscriber location for communicating via satellite signals to a processing center the detection of the presence of an intruder in a predetermined area or in a plurality of predetermined areas is met by the remote monitor transceiver being associated with a communication link that alerts the base station when the one or more object sensors at the remote monitor detect an intrusion (col1 39-49 and col2 4-11). The communication link associated between the base station and remote monitors would inherently have an antenna to accomplish the satellite communications as suggested in column 2, lines 4-11. The term 'subscriber' is interpreted to mean a location associated with the central processing center that is being monitored;

The claimed detection interface apparatus capable of operatively associating with means for detecting the presence of an intruder in the predetermined area or in one or more of the plurality of predetermined areas is met by the one or more object sensors detecting the presence or intrusion at a remote monitor area (col1 39-49);

The claimed satellite signals encode data alerting the processing center to the presence of said intruder in said predetermined area or said one or more of the plurality of predetermined areas is met by the monitored area transceiver transmitting modulated data that the base station demodulates to determine the site that sent the signal (col6 1-13);

The claimed satellite signals received at the subscriber antenna from the processing center carry data to activate an alarm/warning system at the subscriber location is met by the remote sites being activated by the base station (column 9, lines 47-55).

Regarding claim 37, the claim is interpreted and rejected as claim 6 stated above.

Regarding claim 38, Dubats discloses the following claimed subject matters:

The claimed method comprising detecting the presence of an intruder in a predetermined area or a plurality of predetermined areas is met by the one or more object sensors detecting the presence or intrusion in one or more monitored areas (col1 44-49);

The claimed method comprising communicating via satellite signals from a subscriber location to a processing center the detection of the presence of the intruder in the predetermined area or in one or more of the plurality of predetermined areas is met by communication link being a satellite link and the remote monitor transmitting the

event when an intrusion is detected across the communication link to the base station (col1 39-49 and col2 4-11);

The claimed method comprising satellite signals encoding data alerting the processing center to the presence of said intruder in said predetermined area or said one or more of the plurality of predetermined areas is met by the monitored area transceiver transmitting modulated data that the base station demodulates to determine the site that sent the signal (col6 1-13);

The claimed receiving means to receive signals from the processing center is met by the transceiver (column 5, lines 47-61);

The claimed satellite signals received from the processing center carry data to activate an alarm/warning system at the subscriber location is met by the remote sites being activated by the base station (column 9, lines 47-55).

### ***Claim Rejections - 35 USC § 103***

3. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

4. Claims 2, 16 and 30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dubats in view of Dillon et al. (Dillon; US Patent 6,658,463).

Regarding claim 2, Dubats discloses all of the claimed limitations except for the claimed security system wherein the communicating means comprises a satellite return

Art Unit: 2612

channel. Dillon discloses *Satellite Multicast Performance Enhancing Multicast HTTP Proxy System And Method* that teaches using a satellite return channel to accomplish two-way communication in common satellite networks (col3 58-67). Utilizing a satellite return channel in the device of Dubats would accomplish the two-way communication needed by the communication link when the remote monitor and base stations communicate with each other. Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device disclosed by Dubats according to the teachings of Dillon to use a satellite return channel to accomplish the two-way communication.

Regarding claims 16 and 30, the claims are interpreted and rejected as claim 2 stated above.

5. Claims 3, 4, 17, 18, 31 and 32 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dubats in view of Taylor (US Patent 6,643,510).

Regarding claim 3, Dubats discloses all of the claimed limitations except for the claimed security system wherein the satellite signals are transmitted at a DBS frequency. Taylor discloses *Mobile Platform Real Time Availability And Content Scheduling System And Method* that teaches a satellite communication link that operates on the DBS frequency (col7 10-19). Configuring the device of Dubats to operate the communication link on a satellite frequency that is concurrent with the DBS

Art Unit: 2612

frequency would be beneficial because the DBS frequency is a common frequency used by satellite systems. Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device disclosed by Dubats according to the teachings of Taylor to set up the satellite signals to operate in the DBS frequency range.

Regarding claim 4, Dubats discloses all of the claimed limitations except for the claimed security system wherein the satellite signals are transmitted at a FSS frequency. Taylor teaches a satellite communication link that operates on the FSS frequency (col7 10-19). Configuring the device of Dubats to operate the communication link on a satellite frequency that is concurrent with the FSS frequency would be beneficial because the FSS frequency is a common frequency used by satellite systems. Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device disclosed by Dubats according to the teachings of Taylor to set up the satellite signals to operate in the FSS frequency range.

Regarding claims 17 and 31, the claims are interpreted and rejected as claim 3 stated above.

Regarding claims 18 and 32, the claims are interpreted and rejected as claim 4 stated above.

6. Claims 9 and 23 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dubats in view of Stadler (US Patent 6,764,261).

Regarding claim 9, Dubats discloses all of the claimed limitations except for the claimed security system wherein the detection of the intruder interrupts the transmission of satellite signals. Stadler discloses *Locking Device And Method For Catch Basin And Manhole Covers, And The Like* that teaches a device that monitors for the occurrence of a specific security event and constantly sends out signals from the device to a remote location, upon the detection of the specific security event the device halts sending the signals so the remote location can determine that the event has occurred (col4 57-63). Altering the reporting mode of the device of Dubats to constantly send signals to the base station until an intrusion is detected by the one or more object sensors would not only allow the device to detect the intrusion but it would also allow it to detect a fault in the system if a particular component failed in the communication link as that too would cause an event condition. Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device disclosed by Dubats according to the teachings of Stadler to alter the reporting mode so that detection of intrusion would stop the transmission of satellite signals.

Regarding claim 23, the claim is interpreted and rejected as claim 9 stated above.

Art Unit: 2612

7. Claims 11 and 25 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dubats in view of Jang (US Patent 6,614,884).

Regarding claim 11, Dubats discloses all of the claimed limitations except for the claimed security system wherein the frequency of the satellite signals corresponds to a predetermined security condition. Jang discloses *Automatic Home Alarm System And Method* that teaches a security system with a plurality of monitored areas, each monitored area has a sensor that is assigned a particular frequency when it reports to the signal-receiving unit (col4 33-47). Modifying the communication link of Dubats to assign each monitored area a particular frequency would help the base station to determine which particular area is reporting an intrusion event. Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device disclosed by Dubats according to the teachings of Jang to assign each particular monitored area a particular frequency.

Regarding claim 25, the claim is interpreted and rejected as claim 25 stated above.

8. Claims 12, 14, 26 and 28 are rejected under 35 U.S.C. 103(a) as being unpatentable over Dubats in view of Dohrmann (US Patent 6,577,234).

Regarding claim 12, Dubats discloses all of the claimed limitations except for the claimed security system further comprising selection means for selecting an active or inactive mode for the security system. Dohrmann discloses *Security System* that teaches a security system that has a selection means for arming and disarming the security system (col1 41-58). Adding a selection means to Dubats to allow for the system to be turned active or inactive would add flexibility to the device and allow for the device to be turned off in particular areas that do not need to be monitored all of the time. Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device disclosed by Dubats according to the teachings of Dohrmann to include selection means to set the security system in an active or inactive mode.

Regarding claim 14, Dubats discloses all of the claimed limitations except for the claimed security system further comprising means for providing local response to the detection of the intruder. Dohrmann teaches a local response to the triggering of the security system (col1 41-58). Adding a means for local response to Dubats would allow for notification of the intrusion event to users who are within the vicinity of the remote monitored areas and allow them to react accordingly. Therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to modify the device disclosed by Dubats according to the teachings of Dohrmann to include a local response in the security system.

Regarding claim 26, the claim is interpreted and rejected as claim 12 stated above.

Regarding claim 28, the claim is interpreted and rejected as claim 14 stated above.

9. Claim 39 is rejected under 35 U.S.C. 103(a) as being unpatentable over Dubats in view of Saylor et al. (Saylor; US Patent 6,661,340).

Regarding claim 39, Dubats discloses the following claimed subject matters:

The claimed method comprising detecting the presence of an intruder in a predetermined area or a plurality of predetermined areas is met by the one or more object sensors detecting the presence or intrusion in one or more monitored areas (col1 44-49);

The claimed method comprising communicating via satellite signals from the subscriber location to a processing center the detection of the presence of the intruder in the predetermined area or in one or more of the plurality of predetermined areas is met by communication link being a satellite link and the remote monitor transmitting the event when an intrusion is detected across the communication link to the base station (col1 39-49 and col2 4-11);

The claimed method comprising satellite signals encoding data alerting the processing center to the presence of said intruder in said predetermined area or said

one or more of the plurality of predetermined areas is met by the monitored area transceiver transmitting modulated data that the base station demodulates to determine the site that sent the signal (col6 1-13).

Dubats does not specifically disclose the claimed receiving and processing at the processing center the satellite signals to produce a local response at the subscriber location. Saylor discloses *System And Method For Connecting Security Systems To A Wireless Device* that teaches a localized station for detection of alarm conditions and a central security network that receives the alarm information and after confirmation by a user, will initiate a localized alarm (columns 9 and 10).

### ***Response to Arguments***

10. Applicant's arguments with respect to claims 1-39 have been considered but are moot in view of the new ground(s) of rejection.

### ***Conclusion***

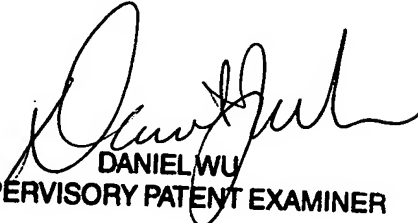

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Travis R. Hunnings whose telephone number is (571) 272-3118. The examiner can normally be reached on 8:00 am - 5:00 pm M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Daniel J. Wu can be reached on (571) 272-2964. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
